

SOILUTIL

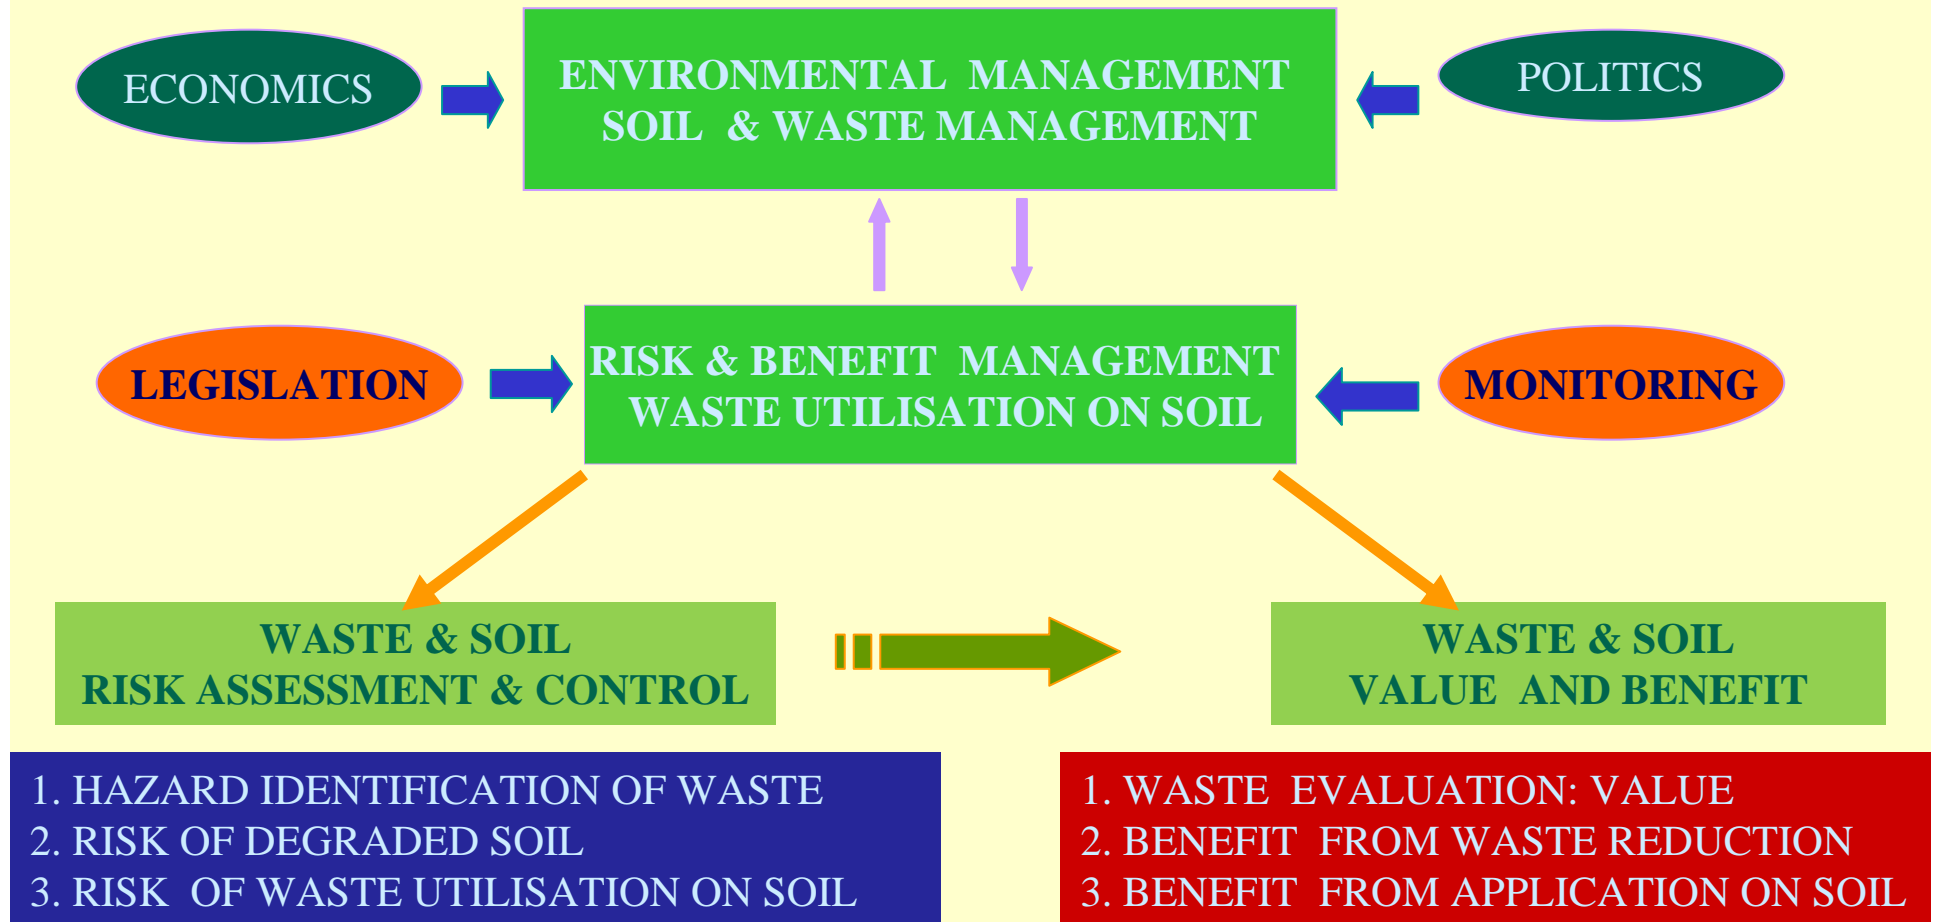

Waste application on soil management concept and results

Gruiz Katalin

Budapest University of Technology

RISK MANAGEMENT OF WASTE UTILISATION ON SOIL

WASTE UTILISATION ON SOIL

Waste pre-treatment: comminution, selection, fractionation

Soil amelioration: sandy soil, compacted soil, low humus soil

Soil amelioration : low nutrient soils

Nutrient supply: for plants with special needs

Erosion control by physical stabilisation: soil-texture development

Erosion control by biological stabilisation: humus-content & vegetation

Remediation of contaminated soil

Soil remediation by chemical stabilisation: metal contaminated soil

Cultivation medium from waste

Geotechnical constructions: for water-permeable sealing

Geotechnical constructions: capillary barriers and capillary layers

Waste elimination in the soil by biological CO₂ sequestration

MANAGEMENT PHASE I.

SOIL EVALUATION

HAZARD: Type of degradation, contamination or other threat

NEEDS: Parameters, substances required

LOCALITY

WASTE EVALUATION

HAZARD: hazardous substance content and consequent limitations

VALUE: of waste from the point of view of the soil

PRODUCED AMOUNT AND LOCALITY

RISK EVALUATION of waste application on soil

SITE SPECIFIC RISK of waste application on soil

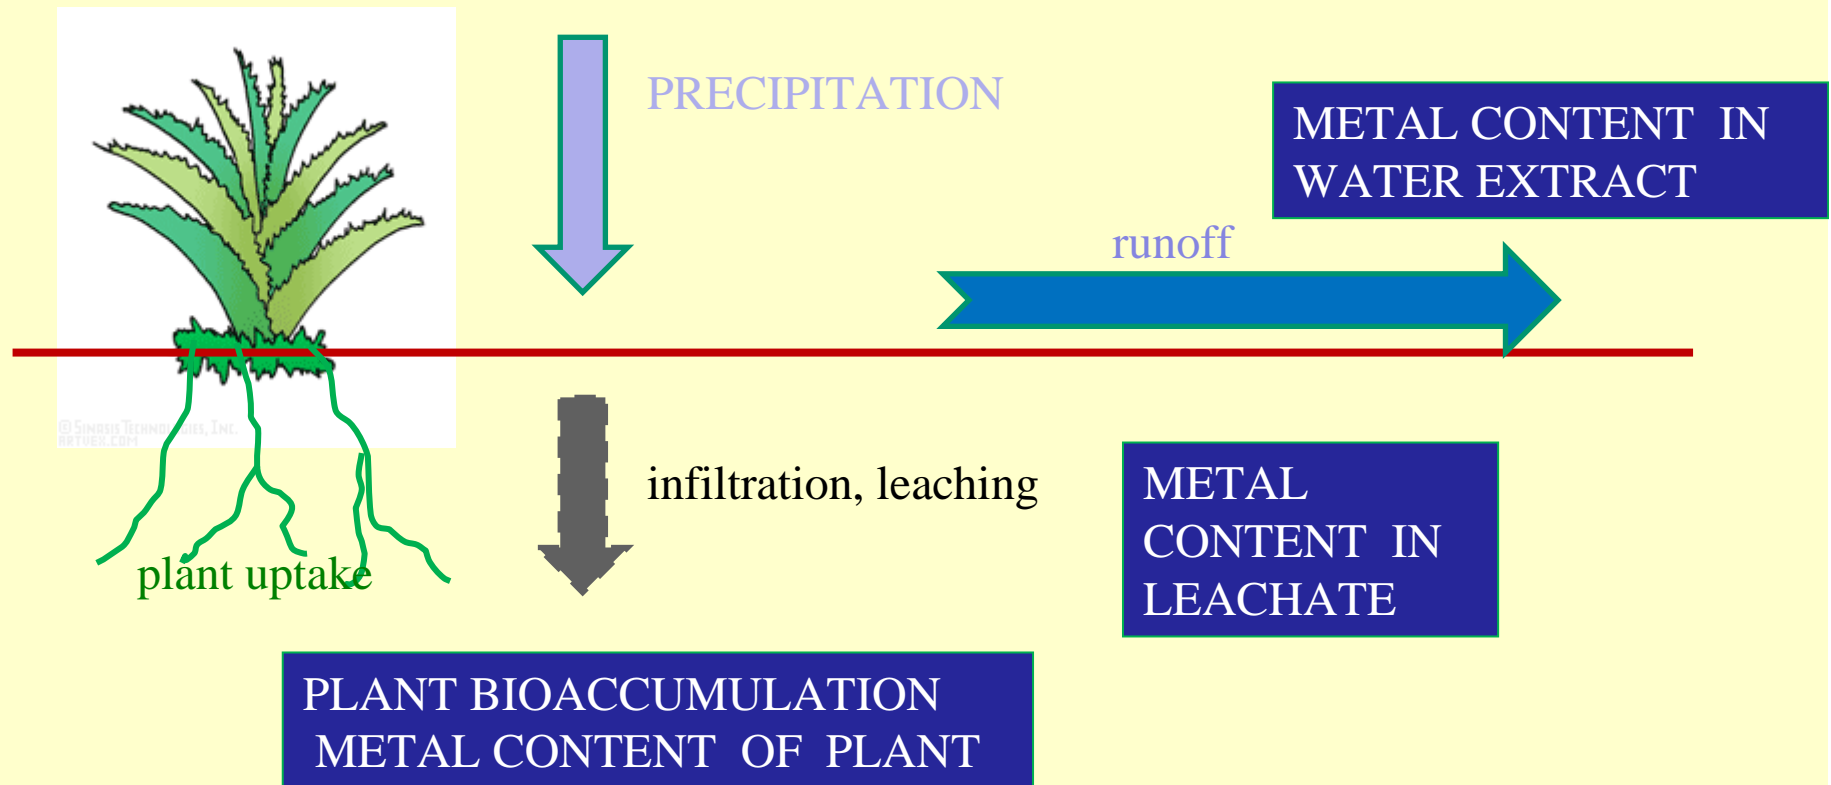

REGIONAL AND GLOBAL RISKS, SUSTAINABILITY

FLY ASH TREATMENT OF METAL CONTAMINATED AND DEGRADED ACIDIC SOIL/ROCK

RISK EVALUATION

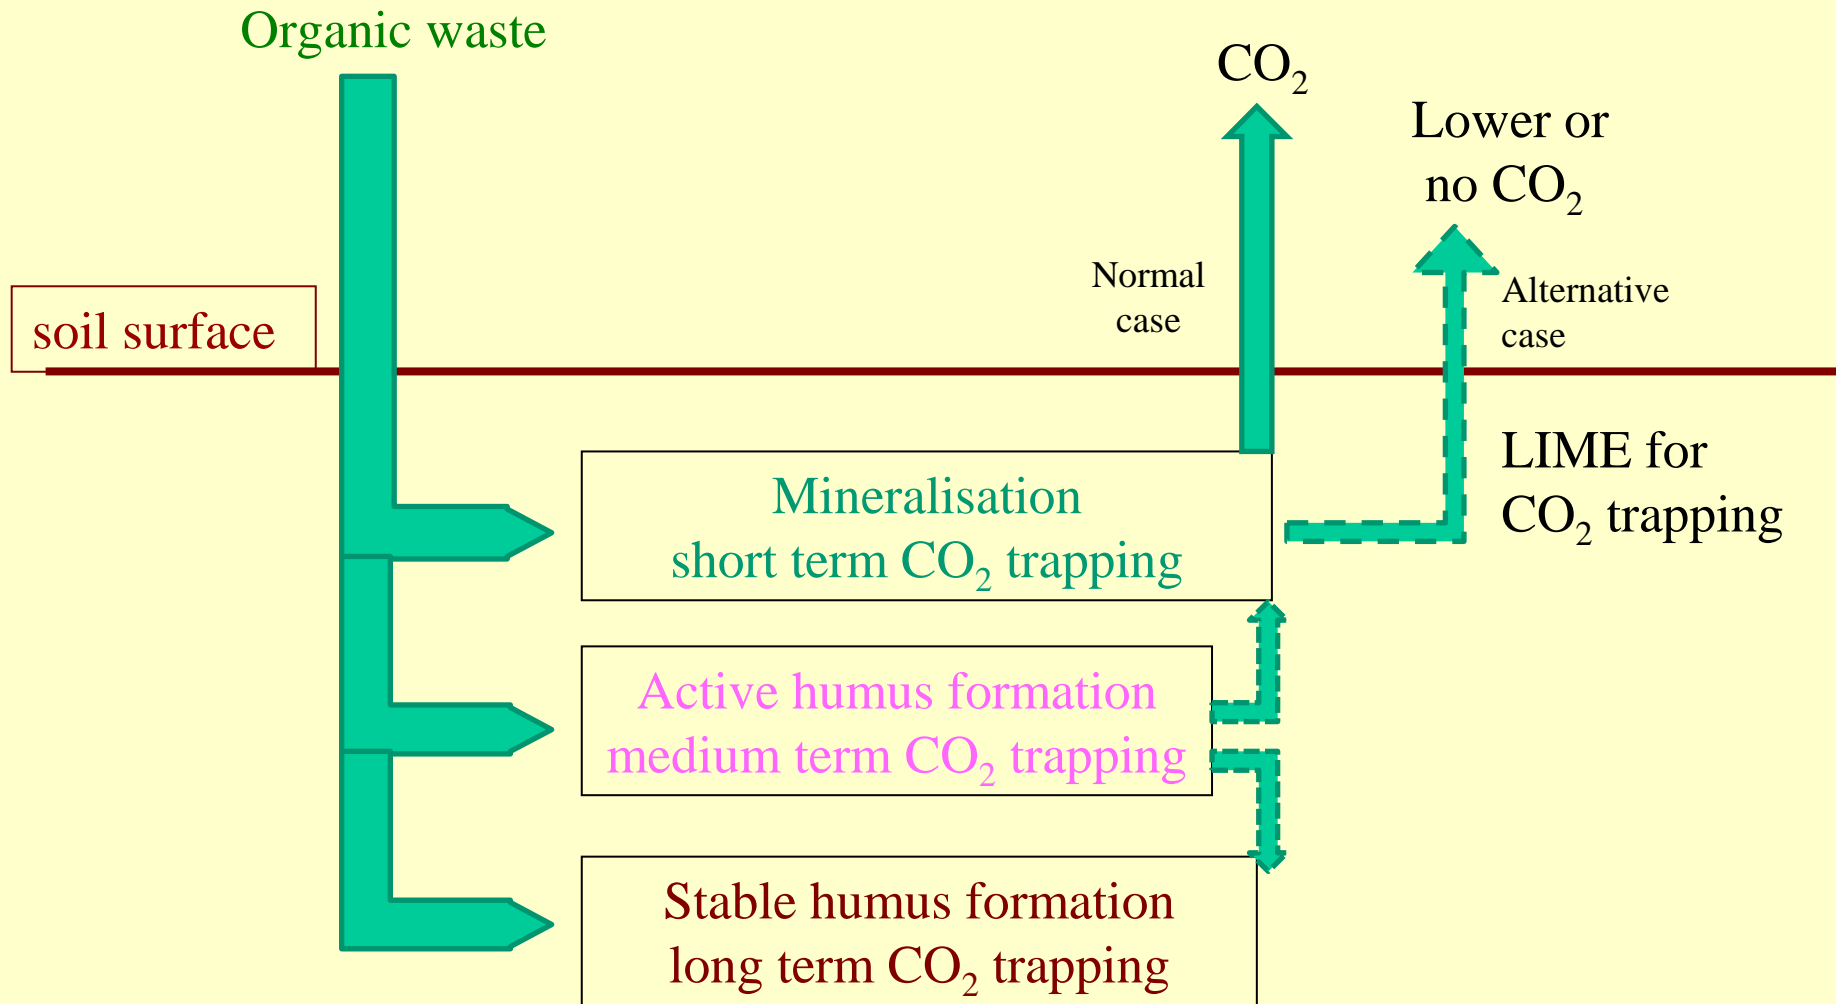

FLY ASH TREATED METAL-CONTAMINATED AND DEGRADED ACIDIC SOIL/ROCK FIELD DEMONSTRATION

Treatment	Water extract (mg/kg soil)				Plant bioaccumulation in bioassay (mg/kg dry plant)				Naturally grown grass metal uptake (mg/kg dry plant)			
	Cd	Zn	Pb	As	Cd	Zn	Pb	As	Cd	Zn	Pb	As
Control	0.24	25.7	0.56	132	1.9	345	11.3	0.8	2.8	561	117	13.0
5% fly ash	0.01	0.06	0.06	40.5	0.3	85	3.5	0.8	0.5	190	2.0	0.8

RED-MUD TREATED METAL-CONTAMINATED AND DEGRADED ACIDIC SOIL/ROCK MICROCOSM TEST

	Water extractable metal in soil mg/kg		Contaminated soil plant uptake in bioassay mg/kg plant	
	Cd	Zn	Cd	Zn
Treatment				
Control	0.01	0.48	2.2	119
5% red-mud	<0.004	0.10	0.35	88

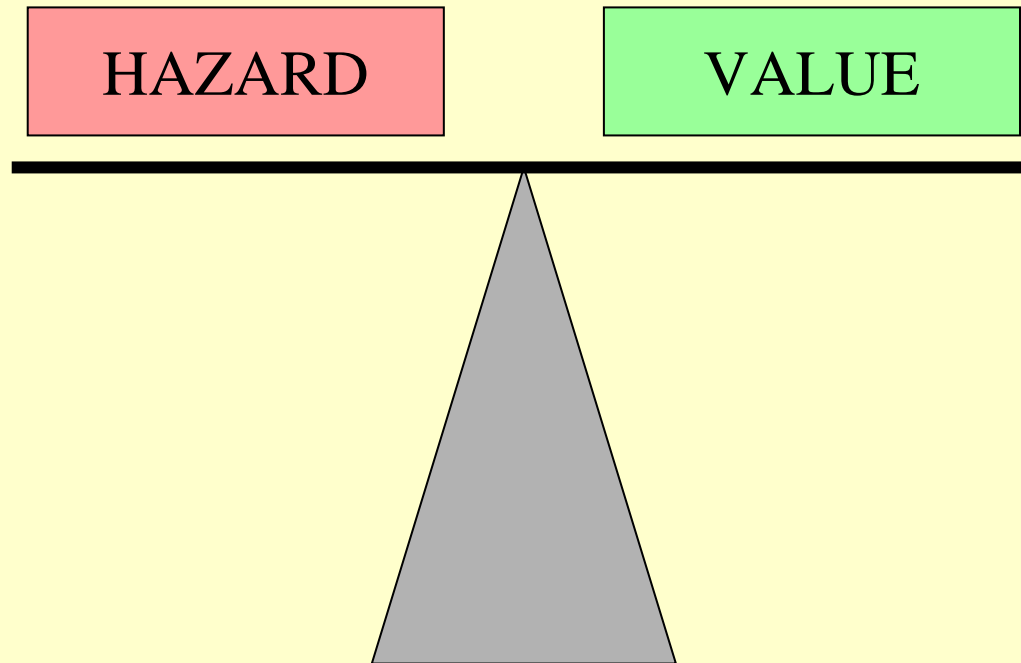

BIOLOGICAL CO₂ SEQUESTRATION

CO₂ PRODUCTION AND CELL CONCENTRATION OILY WASTE APPLICATION ON SOIL

Treatment	CO ₂ discharge (mmol)	Cell-concentration (cell/g soil)	Specific CO ₂ discharge (mmol/cell 10 ¹⁰)
Control	1.0	9.0 x 10 ⁶	2.0
5% oily waste	1.9	7.5 x 10 ⁷	0.5
5% oily waste + lime	1.2	2.3 x 10 ⁸	0.1

EVALUATION OF WASTES

DIFFERENTIATION BETWEEN HAZARD AND RISK

Wastes are handled today based on their default hazard, which is in contrast with the risk based approach.

The same (hazardous) waste pose different scale of risk depending on soil type and land use.

Time is and important factor too for biodegradable waste and waste applied as plant nutrients.

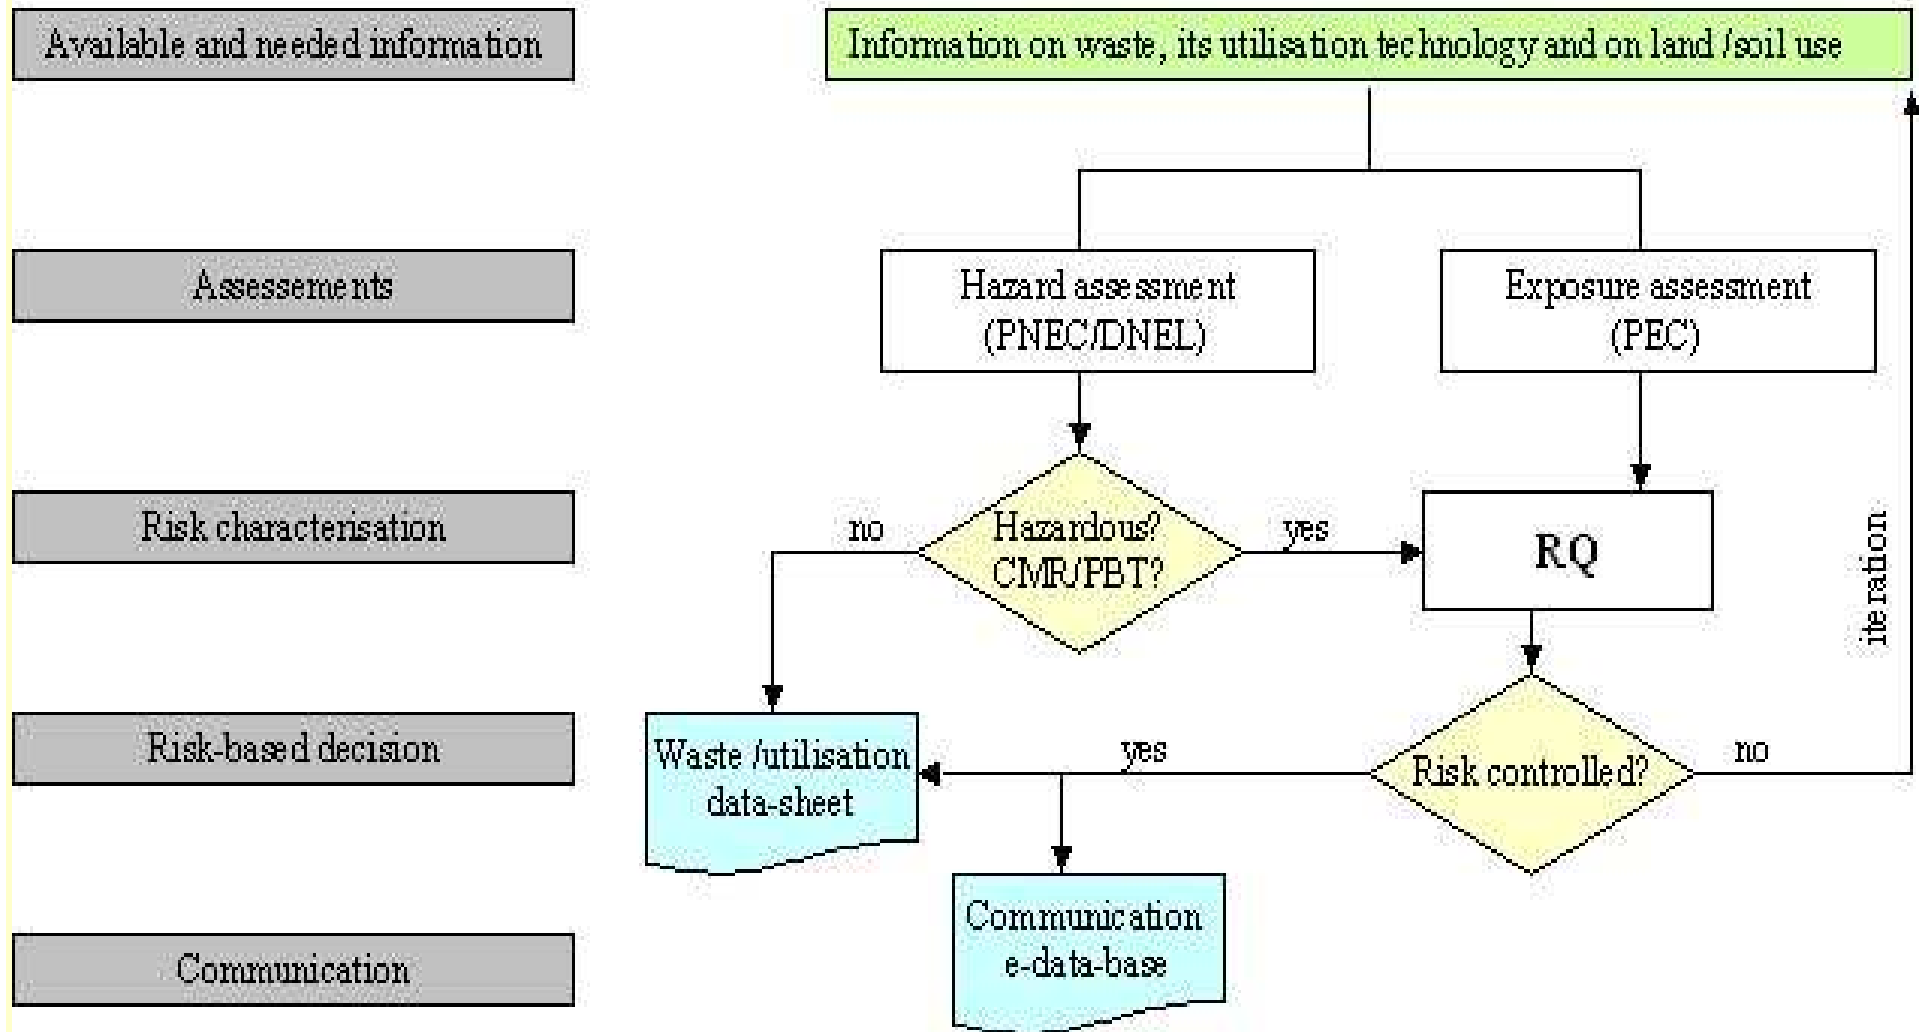

The right decision can be made only based on the quantified risks and benefits of the waste at the place of application.

Risk and benefit can be calculated based on the substance/material contents of the waste. It means that similar to chemical substances (under REACH regulation) the existing risk should be controlled.

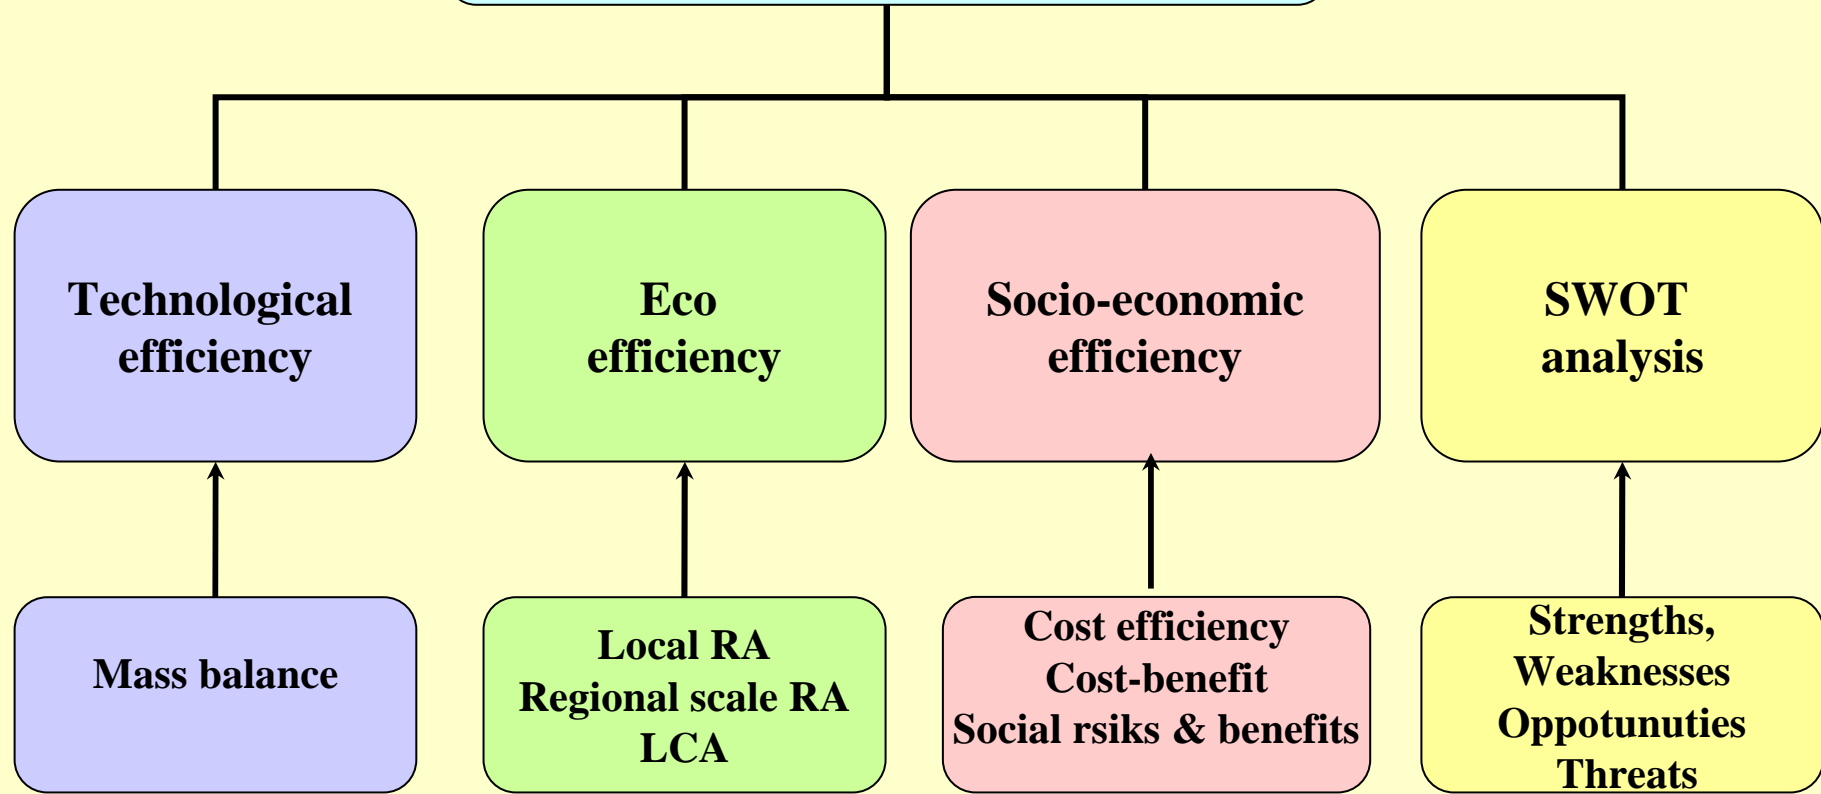

ASSESSMENT OF WASTE APPLICATION ON SOIL

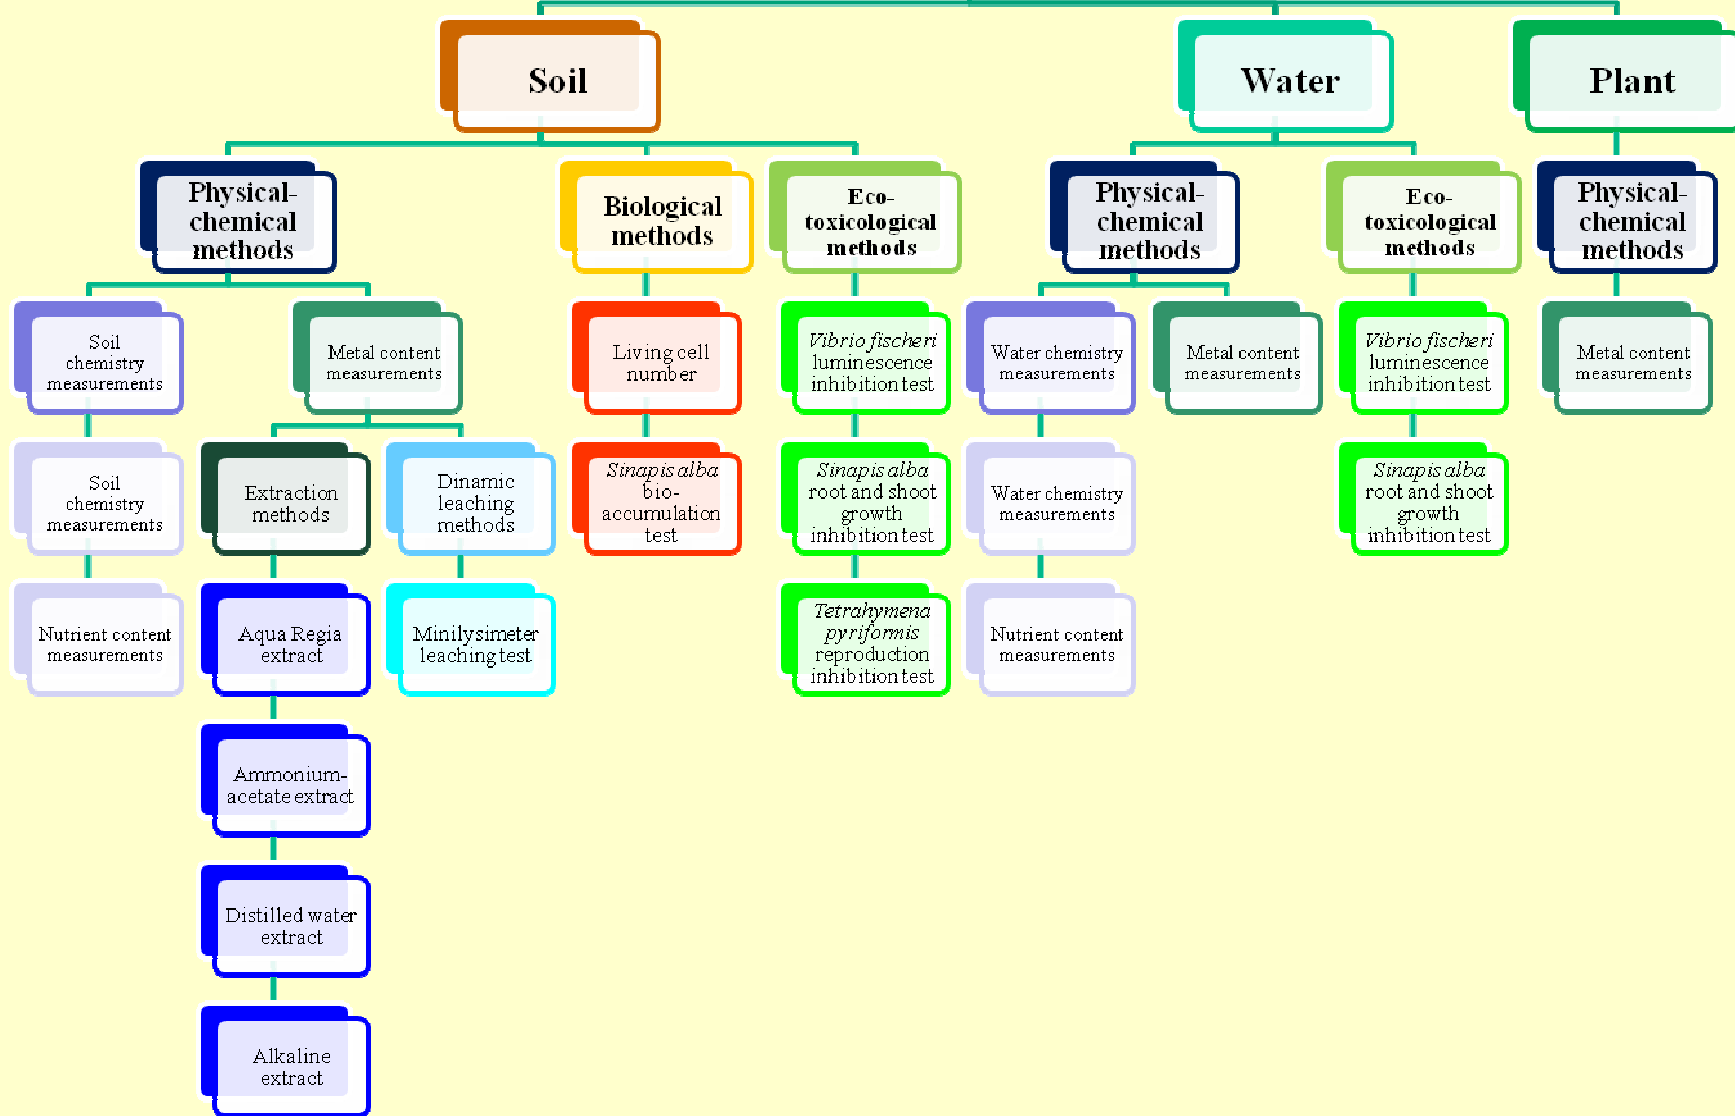

Environmental risk management of waste utilisation on soil

**Comparative evaluation and verification
of waste utilisation technologies**

Integrated monitoring for chemical stabilisation of metal contaminated soil using waste

MANAGEMENT PHASE ii.

INVENTORY OF SOIL DEGRADATION AND THREATS
SOIL EVALUATION MAPS – DATABASE

INVENTORY OF WASTE PRODUCTION
WASTE MAPS – DATABASE

INVENTORY OF TECHNOLOGIES & APPLICATIONS
INTERGRATED TECHNOLOGY MONITORING
VERIFICATION OF WASTE APPLICATION ON SOILS
LEGAL BACKGROUND: RISK BASED WASTE MANAGEMENT
INSTEAD OF WASTE: SUBSTANCE, PRODUCT, BY-PRODUCT

PARTICIPANTS:
